A. Message from the Partners

Dear Limited Partners,

The updates you will see below provide an overview of portfolio performance for the first half of 2026 with detailed updates provided in the sections below.

Portfolio Update

Global and local market conditions remain challenging and, rather than repeat the broader economic commentary from previous reports, I will focus this update on developments within the portfolio and our priorities for the remainder of 2026.

Scaleup Founders Fund is now in its third year. The fund was intentionally constructed as a balanced portfolio comprising predominantly early-stage startups, complemented by a number of strategic later-stage investments. This approach allows us to capture the higher long-term growth potential of early-stage companies while benefiting from the stronger commercial traction and shorter value realisation horizon of more mature businesses.

We are pleased to report that the portfolio is progressing broadly in line with our expectations for this stage of the fund. Following the product development, customer discovery and business model refinements that characterised the first two years, most of our early-stage companies have now established clearer market positioning and are focused on growing revenues, expanding their customer base and building scalable businesses. While each company continues to progress at its own pace, the portfolio as a whole has become noticeably more stable and commercially focused.

As with any early-stage venture fund, not every investment will succeed. Venture capital returns are typically driven by a small number of exceptional performers that generate the majority of a fund's value, while some investments inevitably underperform or cease operations despite the best efforts of founders and investors.

During the reporting period, the Fund recognised an impairment on one portfolio company (Stayhere) following the completion of the annual audit and has commenced the necessary legal and administrative steps to conclude the investment in an orderly manner. We have also initiated a formal review of Petotum where prolonged

communication challenges have prevented us from verifying its current operating status. Further details on both matters, including the actions being undertaken by the Fund, are provided in the respective portfolio company updates later in this report.

Encouragingly, the portfolio's stronger performers like iMotorbike, Sonicboom and Kiddocare continue to build momentum, whilst our strategic investments in ERTH and FEFIFO –continue to strengthen their commercial position. Despite the challenging fundraising environment, Kiddocare has progressed in their Series A fundraising activities whilst both Buzz and Kabel are navigating the final processes of grant funding with Cradle Fund.

Although the fund is still at an early stage of its lifecycle and we do not expect significant portfolio exits until the later years of the fund, we are excited to report that Sonicboom has appointed an M&A advisor and has commenced discussions with several potential acquirers. Should a transaction materialise, it would represent an earlier-than-expected value realisation for the fund and demonstrate the benefits of maintaining a balanced portfolio of both early-stage and more mature growth companies.

Please find below the individual company reports for your kind attention. As always, should you require any further information or clarification, please do not hesitate to contact me or the assigned partner for each of the portfolio companies. We thank you for your continued trust and support as we work alongside our founders to build long-term value and deliver successful outcomes for all our investors.

We wish you a successful H2 2026.

Sincerely,

Dr. Sivapalan Vivekarajah

On Behalf of the Partners of ScaleUp Malaysia Accelerator

B. Key Highlights from Portfolio H1 2026

C. Individual company highlights

1. Buzz (formerly known as BeeBag)

Partner-in-charge: Aaron Sarma

H1 2026 Performance Summary

H1 2026 saw Buzz consolidate its pivot from a consumer cashback application into a commerce-media and rewards-infrastructure business serving e-wallets and digital banks. Rather than developing new features, management ran the half on a deliberately sales-driven footing, with the product substantially built out, and concentrated on two priorities: expanding the roster of fintech distribution channels beyond Touch 'n Go, and acquiring paying FMCG brands. The paying-brand base grew to 25 (from 12 at the end of 2025), and the platform has now processed approximately 190,000 unique redemptions and distributed roughly RM33,000 in cashback to date (average RM0.17 cashback per redemption).

The defining commercial development was a secured revenue-share agreement with Touch 'n Go, under which Buzz earns a 15% share of advertising value it brings onto the platform — formalising its role as an outsourced deal-sourcing and monetisation partner rather than a standalone rewards app. Management is extending this model to additional partners (AEON Bank and AEON Wallet, Ryt Bank) and has secured TrueMoney Malaysia, opening a potential pathway into Thailand. The company remains extremely lean, with monthly operating expenditure of approximately RM15,000, a runway of eight to ten months, and an active seed raise of USD 400K underway. Management expects full-year 2026 revenue to exceed RM1 million as its advertising, cashback, and channel-partnership streams mature.

Comparison with H2 2025

At the close of H2 2025, Buzz reported FY2025 recognised revenue of RM503.76K (H2 2025: RM293.85K), 12 paying brands against a stated target of 30–40 for 2026, approximately 86,000 registered shoppers with around 13,000 cumulative redemptions, and a monetisation model transitioning toward cost-per-redemption pricing. It had received RM100K of a RM150K PayNet co-funding commitment and expected a capital raise to conclude in Q1 2026. Half-on-half, the business has moved decisively up the

value chain. The monetisation thesis has evolved again — from cost-per-redemption toward an advertising and commerce-media revenue-share model, anchored by the 15% Touch 'n Go arrangement and a premium-to-agency pricing position justified by richer analytics. The paying-brand count roughly doubled to 25, moving toward the 30–40 target, and reported platform reach expanded materially (now measured across a broader funnel of 1.6 million unique visits and 367,000 consenting users). The PayNet relationship has become less certain — the co-funding programme that could have funded further integrations is caught in PayNet's internal restructuring under a new, cost-focused chief executive — but this is offset by new channel wins (TrueMoney) and grant progress with Cradle. The Q1 2026 raise has become a live seed round on a SAFE. In short, the strategic direction has sharpened from "cashback app" toward "monetisation infrastructure for e-wallets", with a leaner cost base and clearer revenue mechanics.

Business Strategy & Planning

Management's 2026 strategy is built on doubling down on fintech distribution channels. Beyond Touch 'n Go, Buzz is pursuing AEON Bank and AEON Wallet and Ryt Bank, and has secured TrueMoney Malaysia — the operator behind the e-wallet used across effectively all 7-Eleven outlets in Thailand — which management hopes will open a route into the Thai market over time. The company has deliberately excluded GX Bank, given its Grab affiliation, though it would ultimately like to integrate into Grab Ads as a major commerce-media player.

The product proposition now spans three layers. The first is the original cashback-offer engine, through which Buzz sources deals and runs rewards programmes on partners' behalf. The second, and the current commercial focus, is app monetisation through advertising: Touch 'n Go demonstrated that users will tolerate in-app advertising and that brands will pay for it, and Buzz now offers other wallets and banks the infrastructure to monetise their apps while bringing the advertiser demand. The third, under development, is an AI-powered "orchestration platform" for commerce media and digital marketing — a single interface through which brands could connect proprietary wallet channels alongside Shopee, Grab, Lazada, Meta, Google, and display, view performance across all of them, and reallocate spend on the basis of AI-generated ROI analytics. Management views this orchestration layer as a potentially significant future product but is prioritising the revenue-generating advertising and cashback lines in the near term, packaging and reselling third-party technology rather than funding heavy new

development ahead of a raise.

The Touch 'n Go Model and Platform Metrics

The Touch 'n Go relationship is now Buzz's anchor. Under the secured arrangement, Buzz receives a 15% share of every advertising ringgit it brings onto the platform, and when pitching FMCG brands it sells both the cashback offer and full-funnel advertising across partner platforms, drawing on the rate cards those platforms provide. A structural headwind is app usability: management observes that a large share of Touch 'n Go users default to basic functions such as peer-to-peer transfers and bill payments and never navigate to the "Go Rewards" section where Buzz's offers sit. A recent Touch 'n Go interface redesign has not clearly improved discoverability, and Touch 'n Go — whose own KPI is to drive deal claims — is pushing the programme through notifications and in-app promotion to counter the plateau this creates.

On a cumulative basis, the platform has recorded approximately 1.6 million unique visits, of which 367,000 users provided consent, around 190,000 completed a unique redemption (240,000 total redemptions including repeats), and 40,000 submitted receipts and successfully claimed cashback — with close to RM33,000 in cashback distributed to date. Management regards the gap between visits, consent, and claims as the principal area of headroom.

Brand Acquisition, Team and Advisory Board

Brand acquisition remains a one-by-one effort: even within large conglomerates, marketing decisions are decentralised across category and brand heads, so there is no single decision-maker to unlock an entire portfolio. Management is therefore focused on building reference case studies — including a prospective Chinese New Year campaign with Ethica (bottler for Pepsi, Good Day, Gatorade, and Sting) valued at around RM500,000 — and is working into a 12-brand FMCG house via its Enchanteur brand. It has also tested the limits of retail partnerships: large grocers such as Lotus's and 99 Speedmart carry limited external cashback budgets because their economics rely on "back-margin" funding retained from brands, though they can provide useful introductions to principal brands.

The internal team remains deliberately lean — the founder Joshua Lim and one colleague, John, supported by contract engineers and business-development resources.

Management has found senior industry advisers far more effective than mid-tier business-development hires: Mayin, an adviser with PepsiCo and Unilever experience, has already introduced several major brands and is engaged on a 10%-per-deal commission, with a possible RM3,000 monthly retainer contingent on grant funding. Separately, Buzz is onboarding Gary Yeow, the former Chief Marketing Officer of PayNet, as an adviser for 0.5% equity plus an option to invest at the current valuation (matching ScaleUp's terms); Gary's connections are expected to open doors to further e-wallet and bank publishers, including Boost Pay and other regional players.

Grants, Fundraising and Investment Outlook

On non-dilutive funding, Buzz has secured Cradle's CIP Spark grant (approximately RM100,000, for development) and is in the final stages of the CIP Sprint grant (approximately RM500,000, for sales and marketing), which is revenue-milestone based and now before Cradle's board; management is reasonably confident of approval and notes the grant would convert to a repayable obligation if revenue KPIs are missed. The earlier PayNet co-funding route to further integrations is, by contrast, uncertain amid PayNet's restructuring.

On equity, Buzz is raising a seed round of USD 400,000 on a SAFE note with a USD 2.5 million cap, in discussions with Singapore-based venture capitalists against an admittedly cautious investment backdrop. We note that Buzz has been raising a round since H1 2025, the team has successfully raised grant money in the interim. Given monthly OPEX of only around RM15,000 the approved CIP Spark grant and existing revenue, the company retains an eight-to-ten-month runway and could raise less than the headline target if needed. Management expects full-year 2026 revenue to exceed RM1 million as advertising, cashback, and channel partnerships compound.

The FY2025 statutory accounts (Beebag Sdn Bhd) underscore the early-stage financial profile. As at 31 December 2025 the company held only about RM31,600 of cash against total assets of RM264,413, was funded in part by RM150,000 of director loans and RM454,254 of redeemable preference shares (investor instruments), and carried negative equity of approximately RM395,149 reflecting accumulated losses, having remained loss-making over the period. This thin liquidity position, alongside reliance on grants and shareholder support, is consistent with the company's capital-light posture but reinforces that closing the seed round and securing the CIP Sprint grant are the key near-term priorities. (The statutory revenue figures do not reconcile cleanly with the

RM503,761 recognised-revenue figure reported in H2 2025; the basis and period should be confirmed – see the note at the top of this update.)

From a portfolio perspective, Buzz remains an early-stage, pre-exit holding, but one with a materially clearer commercial identity than six months ago: a capital-light commerce-media and monetisation layer for e-wallets, with a signed revenue-share anchor, a doubling brand base, and disciplined costs. The key value-inflection points to watch over H2 2026 are conversion of the seed round, approval of the CIP Sprint grant, landing marquee brand case studies such as Ethica, and translating the widening channel roster into recurring advertising revenue. Exit optionality remains longer-dated and will depend on establishing the platform as durable infrastructure across multiple wallets rather than a single-channel dependency.

2. Docspe /Plexis.ai

Partner-in-charge: Andre Sequerah

H1 2026 Performance Summary

Docspe enters H1 2026 as a more focused and mature business than a year ago, and one undergoing a decisive strategic reorientation toward the United States. Management reports that performance is better than H2 2025 and that the business faces no continuity concerns, but declined to disclose specific financials while an active fundraise is underway. The clearest signal of the half is directional: the company has stopped allocating budget to acquiring new clinic customers and is concentrating its enterprise effort on two fronts – a newly launched hospital system within the core Docspe unit, and Plexis.ai, its orchestration and "execution-governance" platform for hospitals.

The defining development is a planned pivot of operations to the North American market from Q3–Q4 2026, underpinned by a collaboration with the Mayo Clinic that management intends to use as its credibility anchor with US prospects. Supporting moves include hiring three senior engineers (based in Brazil, for US-time-zone coverage), an open sales role to be recruited directly from the US, and a fundraising process now targeting US venture capitalists. The founders continue to draw no salary and the company carries no debt. Financial transparency is the principal near-term watch-item for the fund: management's decision to withhold revenue, OPEX, and pricing this period limits independent assessment, and these figures should be revisited at year-end.

Comparison with H2 2025

At the close of H2 2025, Docspe reported approximately RM637K of H1 2025 revenue, a base of 200+ clinics with roughly 9% annual churn, monthly OPEX of roughly USD 7,500, a live Plexis.ai MVP with a signed multi-year contract exceeding RM500K, acceptance into a Mayo Clinic incubator, a stalled Singapore NHG opportunity pending ISO 27001, and a fundraise of USD 2M at a USD 10M pre-money valuation, alongside a stated intention to shift from product-led to sales-led growth. Half-on-half, the strategy has sharpened considerably around a single thesis: the US is the real market, and the company is restructuring to serve it. Clinic acquisition has been deprioritised in favour

of the hospital system and Plexis.ai; the Mayo Clinic relationship has moved from incubator association to the centre of the US go-to-market narrative; fundraising has reoriented from the earlier round toward US VCs; and ISO 27001 — previously framed around Asian government and NHG deployments — is now being resumed to support US entry. The sales-led transition flagged previously is now concrete but still pending, embodied in a single open US sales hire. The most notable change in disclosure posture is the withholding of financials, which management attributes to the live raise rather than to any deterioration.

Business Units: Docspe and Plexis.ai

The company now operates two distinct enterprise-focused units. The first, the core Docspe business, comprises a clinic system and a newly launched hospital system. Management continues to maintain and upgrade the clinic system for existing customers but has ceased dedicating acquisition budget to it, redirecting attention to the higher-value hospital system. The second unit, Plexis.ai, is an orchestration platform — described as an execution-governance layer — that coordinates tasks across a hospital's different systems. Both units target enterprise clients, and the company is explicit that it is no longer pursuing clinic-level customers.

Plexis.ai, launched as a V1 MVP in H2 2025, is being actively advanced in 2026, supported by the three newly hired senior engineers. The company has begun charging some active Plexis customers and has further prospects in discussion, but management declined to disclose pricing, citing the sensitivity of ongoing enterprise negotiations. The strategic intent is unambiguous: Plexis.ai, not the legacy clinic system, is now the company's forward identity and growth engine.

Strategic Pivot to the United States

Management's central decision this half is to concentrate operations on the US market from the third and fourth quarters of 2026, while continuing to service existing Malaysian customers. The rationale is economics: US prospects offer contract sizes three to five times larger than Malaysian equivalents for broadly the same sales effort, against a domestic backdrop of low AI confidence and adoption, difficulty grasping how Plexis.ai integrates into existing operations, acute price sensitivity, and limited buying power. Management — long convinced the US was the better market but previously constrained by product and team maturity — believes the combination of a matured

Plexis platform and Mayo Clinic backing now gives it a credible US narrative. Operationally, this shapes the company's structure. The engineering team is being built in Brazil (the three new senior engineers) to align with US time zones and to support both US customers and ongoing work with the Mayo Clinic; the two founders remain based in Kuala Lumpur; and the planned sales hire is to be recruited directly from the US. The Mayo Clinic collaboration is positioned as the differentiator that opens doors with American hospital prospects and investors alike.

Team, Fundraising and Compliance

The team stands at approximately nine, comprising eight current members plus one open sales role intended to drive US commercial efforts. The business has two founders – Ahmed Shochin and his partner – with all other members fully paid employees; the founders themselves continue to draw no salary, which management frames as a deliberate choice to "stay hungry" rather than a liquidity constraint, and reports company cash flow as sustainable with no debt taken on.

Fundraising is active and now directed at US venture capitalists, among whom management reports genuine appetite. The stated blocker is the absence of meaningful US operations: US investors want to see live American traction before committing, so the company's near-term priority is to land US customers in order to unlock a raise within the next six to twelve months. On compliance, ISO 27001 certification – paused in late 2025 both because Plexis was at MVP stage (making an audit premature and uneconomic) and amid the distraction of the Techstars programme and a period in Japan – is scheduled to resume within roughly 60 days as the company enters the US market.

Investment Outlook

Docspe remains a medium-term, pre-exit holding whose trajectory now hinges almost entirely on execution of the US pivot. The positives are a clearer identity around Plexis.ai, a genuinely larger addressable market, the Mayo Clinic relationship as a credibility wedge, disciplined founder economics, and evident US investor interest. The risks are equally clear: the company is early in a demanding market entry with a single open sales seat, its fundraise is explicitly gated on first landing US customers, ISO 27001 remains to be completed. The key value-inflection points for H2 2026 are the conversion of the first US hospital, US VC raise and resumption of ISO certification.

3. Huddle

Partner-in-charge: Renuka Sena

Recap of Progress Since Investment

We invested in Huddle in 2024. Since then, it has undergone a deliberate evolution from a sports livestreaming platform into an integrated sports technology company built around AI-enabled camera infrastructure, digital athlete services and recurring software revenues. While this transformation has taken longer than initially anticipated to be validated, management has consistently executed against a clear strategy of building a scalable platform rather than pursuing short-term event-based revenues.

Over the past several years, the company has progressively validated each stage of its business model. It successfully transitioned away from an advertising-supported model towards subscription-based revenue from sports venues (B2B), expanded average revenue per customer through statistics, highlights and premium digital content (B2B and B2C), secured partnerships with nationally recognised sporting organisations that validated enterprise demand, and more recently shifted towards AI camera infrastructure that generates recurring revenue opportunities beyond individual sporting events.

Rather than representing changes in strategy, these milestones reflect the gradual maturation of Huddle's business model. Each phase has reduced a key commercial risk while strengthening the long-term investment thesis.

Huddle's Evolution Since Investment

Period	Key Milestone	Risk De-risked / Validated
Initial Commercialisation	Transitioned from advertising to subscription-based venue customers	Demonstrated that venues are willing to pay for Huddle's technology platform.

Platform Expansion	Introduced statistics, highlights and premium digital content	Validated the ability to increase revenue per customer beyond basic subscriptions.
Enterprise Validation	Secured partnerships with organisations including MSSM, major sporting events and leading consumer brands	Demonstrated that Huddle's technology could be trusted and deployed at national scale.
Infrastructure Scaling	Expanded AI camera deployments and fixed venue installations	Validated that infrastructure creates recurring revenue opportunities while improving operational scalability.
Multi-Sport Platform	Expanded beyond basketball into broader amateur sports and, more recently, commercial pickleball venues	Demonstrated that Huddle's technology platform is adaptable across multiple sports, significantly expanding its addressable market.

With many of these foundations now established, the company's next stage of growth will increasingly depend on accelerating AI camera deployments, expanding recurring revenues and leveraging its growing ecosystem of venues, athletes and digital services. The focus has shifted from proving the business model towards executing at greater scale.

H1 2026 Progress Summary

Huddle generated approximately RM620,000 in revenue during the first half of 2026 despite a slower start to the year as the earlier festive period and school holidays delayed the commencement of several sporting competitions. This seasonal slowdown is typical of Huddle's business, with activity accelerating as school and amateur sports competitions resumed. During the period, the company continued to execute against its long-term strategy of building an integrated sports technology platform, expanding its AI camera footprint, securing its first commercial pickleball deployment, strengthening

its B2B and B2C product ecosystem, and progressing strategic partnership discussions that could support future growth.

The first half also demonstrated the continued evolution of Huddle's business model. While AI camera deployments remain the foundation of the platform, an increasing share of revenue is now generated from higher-value digital services such as player highlights, statistics and other content offerings. This reflects management's strategy of using AI camera infrastructure not simply as a source of subscription revenue, but as the gateway to multiple recurring revenue opportunities across venues, leagues, teams and athletes.

Revenue and Financial Performance

Approximately RM330,000 of first-half revenue was generated from end-customer services, primarily player highlights and game statistics, while RM290,000 came from AI camera rentals, equipment installations and system deployment for venue and competition partners.

From an investment perspective, this changing revenue mix represents an important milestone in the maturation of Huddle's business model. When the company transitioned away from an advertising-based model several years ago, the initial objective was to validate recurring venue subscriptions through AI camera deployments. As the installed camera network has grown, management has demonstrated that each deployment can support multiple revenue streams beyond the venue subscription itself. The fact that digital services now contribute a larger share of revenue than the underlying camera deployments provides encouraging evidence that the platform is beginning to capture greater lifetime value from each venue, league and athlete within its ecosystem. While execution remains the key focus going forward, this evolution strengthens the long-term scalability of the business model.

Market Development

A key milestone during the first half of 2026 was the successful deployment of Huddle's first commercial pickleball venue, with five AI cameras installed across the facility. Since inception, Huddle has built its platform around organised amateur sports, initially focusing on school-based competitions before expanding into amateur leagues, club competitions and other organised sporting events. These segments have provided a

structured environment to validate the company's AI camera infrastructure and digital services.

Pickleball represents an interesting extension of this strategy. Unlike traditional organised leagues, participation is largely venue-based and recreational, attracting a broader demographic of players with more frequent participation throughout the year. This potentially broadens Huddle's addressable market beyond organised competitions and creates opportunities to evaluate how a recreational sports environment influences both B2B revenues from venues and B2C revenues from players purchasing digital content and services. While still at an early stage, this deployment provides an opportunity for management to assess whether the recreational sports segment can become a meaningful complement to Huddle's established presence in organised amateur sports.

Product Development and Platform Evolution

From the outset of our investment, the objective was not simply to increase the number of AI cameras deployed, but to build a platform that places the athlete at the centre of the sporting ecosystem. While venues, leagues and competitions provide the infrastructure for games to be played, the long-term value lies in creating a persistent digital profile for each athlete that grows throughout their sporting journey. Huddle's platform captures statistics, match history, highlights and achievements that are valuable not only to athletes themselves, but also to coaches, clubs, schools, scholarship providers and, over time, potentially sponsors and talent scouts.

The company's B2B products—including Huddle Venue, Huddle League, Huddle Live and Huddle Stats—provide the operational infrastructure for venues, leagues and sporting organisations to capture games efficiently. These deployments generate the video, statistics and data that power Huddle's consumer products, including Huddle Profile, Huddle Highlights and Huddle Community. Rather than operating as separate products, the B2B and B2C offerings were designed to reinforce one another: each additional camera deployment increases the volume of athletes and games entering the platform, while every additional athlete profile increases the value of the platform to leagues, venues and other ecosystem participants.

An encouraging milestone emerging during the first half of 2026 is that revenue generated from these downstream digital services has now exceeded revenue generated from camera subscriptions and installations. This validates a key element of

the original investment thesis—that AI camera deployments are not merely a source of recurring venue subscription revenue, but the foundation for multiple higher-value revenue streams generated throughout the lifecycle of every recorded game. While still at an early stage of scaling, this provides growing evidence that each deployed camera has the potential to create value well beyond its initial installation through recurring engagement with athletes and the broader sporting ecosystem.

Outlook for the Remainder of 2026

Management expects business momentum to strengthen during the second half of 2026 as more organised sporting competitions enter their active seasons and recently deployed AI camera installations generate increasing activity across livestreaming, statistics, highlights and athlete services.

The priority for the remainder of 2026 is not to materially change strategy, but to continue executing against a business model that has been progressively validated over recent years. This includes expanding AI camera deployments across additional venues, building on the initial commercial rollout within pickleball, strengthening adoption of Huddle's integrated platform and, importantly, demonstrating that increased camera deployment consistently translates into growth across both recurring venue subscriptions and the wider portfolio of digital services.

As these relationships become increasingly measurable over time, management will be better positioned to demonstrate the long-term economics of the platform and the lifetime value created by each camera deployment. Establishing this operating track record will be an important milestone as Huddle considers future funding options to support the next phase of growth.

4. Kabel

Partner-in-charge: Xelia Tong

H1 2026 Performance Summary

H1 2026 marks a decisive strategic evolution for Kabel, from a skills-based hiring marketplace into a "talent intelligence platform" monetised through a structured programme it calls DXP. Under DXP, companies sponsor real business problems that groups of three to five students solve over a ten-week sprint; the work is captured on the Kabel platform, which then derives the skills and competencies each candidate demonstrates. Launched in January 2026, DXP has been the company's principal activity and revenue engine throughout this first half, and management reports it now represents roughly 92% of operating revenue.

Financially, the first half shows clear top-line progress and tightened costs. DXP has generated approximately RM256K of the roughly RM277K in operating revenue recorded, already exceeding the RM173K reported for the whole of FY2025, while the monthly burn has been cut to around RM46K following a staff departure and the closure of the physical office in favour of fully remote operations. The company also secured RM500K of Cradle grant funding that is in final legal staging and expected to conclude around six weeks. Kabel operates at or near break-even in stronger months on a lean five-person team, and management has imposed a deliberate hiring freeze to refine the DXP "engine" before scaling. The near-term priorities are disbursement of the Cradle grant, conclusion of ongoing convertible-loan discussions with existing shareholders, and consistent achievement of the three-to-four-projects-per-month break-even threshold.

Comparison with H2 2025

At the close of H2 2025, Kabel reported FY2025 revenue of **RM173,000 (3.5x on 2024)**, a projected path to break-even "within two to three months", an enterprise offering built around "company ports" and a Hiring-as-a-Service subscription priced at RM14,000–16,000 per month (one enterprise onboarded, two to three in the pipeline), an AI-assessment initiative branded "Talent Signal", and monthly OPEX of around RM60,000. Half-on-half, the business has pivoted materially. The monetisation model

has shifted from recurring enterprise subscriptions toward the project-based DXP programme (RM8,000 per sprint), which now drives almost all revenue; the skills-assessment thesis that underpinned "Talent Signal" has been productised into the DXP talent-intelligence engine; and the cost base has been cut rather than expanded — OPEX is down from approx. RM60K to RM46K, and the office has been given up for a remote model. Operating revenue for the half (around RM277K) has already overtaken the full prior year, and a RM500K Cradle grant has been secured. The enterprise subscription line described previously was not discussed and may have been deprioritised in favour of DXP — a point to confirm. In short, Kabel has narrowed and sharpened its model around a single, working revenue engine, trading the earlier enterprise-subscription ambition for a leaner, student-sprint programme with demonstrable traction.

Kabel's Model and Economics

DXP is a company-sponsored, project-based talent programme. A sponsoring company brings a real problem — most commonly workflow automation, or dashboarding for leadership, with a third category also offered — and a group of three to five students works it over a ten-week sprint, delivering a working system rather than the make-work of a typical internship. The platform records the process and infers each participant's hard and soft skills, including communication (candidates record themselves pitching and presenting), producing an evidence-based alternative to CVs and interviews aligned to "AI-native" ways of working.

The unit economics are fixed and transparent: each project is priced at RM8,000, of which RM3,000 is paid to the student group and RM300 to a mentor (typically a university lecturer), leaving the balance to Kabel; management estimates the current gross margin at approximately 30–40%. Problem statements are industry-agnostic — the programme has spanned seven industries and completed a cross-border engagement with a Hong Kong-based company — and delivery quality is high, with a reported 99.9% completion rate; the negligible failure rate stems from client-side delays where sponsors are too busy to approve the weekly progress checkpoints that keep students moving.

Delivery, Student Outcomes and Quality

The programme's credibility rests on its outcomes. Employers are willing to pay DXP graduates above-market starting salaries – a current record of RM6,000 per month for a fresh graduate – precisely because candidates arrive with demonstrated, delivered work rather than unproven credentials. The model also creates early earning pathways: students still studying can work part-time on a remote basis at RM170 per day, and such arrangements have converted into full-time offers on graduation, in one instance a head-of-department (data analytics) role. These outcomes are central to Kabel's flywheel, drawing higher-calibre students into the platform and, in turn, making the programme more attractive to sponsoring companies.

Team, Operating Model and Sales Strategy

Kabel runs on a deliberately lean five-person team operating as a single unit: the founder Camelia Loh and a senior colleague, TK, front the market and host CEO roundtables; Esther leads go-to-market engineering (social, email automation, SEO); Wedat handles student engagement and on-the-ground reach through lecturers; and Alex maintains the Kabel platform. Following a resignation that will not be backfilled – management intends to "hack it" with AI tooling – and the office closure, the company is fully remote, an arrangement management considers well-suited to the remote-native DXP programme. A hiring freeze is in place until the DXP engine is fully validated, at which point the first planned addition would be a dedicated business-development hire.

Commercially, Kabel sells top-down through CEO roundtables framed around AI strategy, positioning AI-native talent as the delivery mechanism for that strategy. The go-to-market focus for roughly the next eighteen months is winning CEO buy-in; thereafter the company intends to work down into line managers and business heads – the process owners whose workflows the students automate – as its eventual core customer profile. The market remains Malaysia-focused for now, leveraging university channels to sharpen the model before broader expansion, supplemented by opportunistic cross-border work such as the Hong Kong engagement, and the company is redesigning its website around a problem-statement-to-solution matching model.

Fundraising, Financial Position and Investment Outlook

On funding, the RM500K Cradle grant is the key near-term liquidity event, in final legal staging and expected within roughly six weeks – important, as management candidly noted cash is tight in the interim. Separate convertible-loan (debt) discussions remain

ongoing with an existing investor/shareholder. Encouragingly, the founder now draws a salary, and the RM256K of DXP revenue over the half implies an average monthly run-rate broadly in line with the RM46K burn, consistent with management's description of operating around break-even and dipping into profit in stronger months. Management estimates that servicing three to four companies per month represents the break-even threshold.

From a portfolio perspective, Kabel presents a sharper, more disciplined profile than six months ago: a validated, cash-generative programme with strong delivery metrics and compelling student outcomes, a materially lower cost base, and a grant inflow that should extend runway. The trade-off is that growth is intentionally capped for now while the model is refined, and revenue remains modest in absolute terms and concentrated in a single programme priced at a fixed RM8,000. The key milestones to watch over H2 2026 are the Cradle disbursement, conversion of the CEO-roundtable pipeline into consistent monthly project volume above break-even, resolution of the convertible-loan discussions, and the first signs of scaling – which management says will be signalled by its first business-development hire. Exit optionality remains long-dated and contingent on demonstrating that the DXP engine can scale repeatedly beyond its current founder-led, university-anchored base.

5. StayHere

Partner-in-charge: Shan Li

H1 2026 Status Summary

Following the deterioration in StayHere's operating and financial position reported in H2 2025, we can now confirm that the company is no longer operational and there is no realistic prospect of reviving the business. All operating activities have ceased and the company has not resumed trading.

In accordance with the recommendations of the Fund's auditors, the investment in StayHere was recognised as fully impaired and written down in the Fund's audited financial statements for the financial year ended 31 December 2025. Following the completion of the audit, the Investment Committee was updated on the status of the investment and the accounting treatment that had been adopted. The IC subsequently advised that, notwithstanding the accounting write-down, the Fund should continue working towards a proper legal and administrative closure of the investment. Accordingly, over the coming months, the Fund will undertake the activities outlined below to facilitate an orderly wind-down and ensure there are no residual obligations affecting the Fund, the Fund Manager or Limited Partners.

Over the coming months, the Fund will oversee a number of activities, including:

- confirming the company's current financial position and outstanding liabilities;
- ensuring all statutory filing obligations, including tax and regulatory requirements, have been appropriately addressed;
- working with the remaining director to initiate the formal voluntary strike-off process with the Companies Commission of Malaysia (SSM);
- documenting the closure process to ensure there are no residual obligations or liabilities affecting the Fund, the Fund Manager or Limited Partners; and
- monitoring progress until the company has been formally dissolved.

One of the company's co-founders remains contactable and has indicated his willingness to cooperate with the closure process. We will continue working with him, together with the company secretary and relevant advisers, to complete the necessary statutory procedures required for a voluntary strike-off of the company. We will continue

to update Limited Partners on the progress of the legal wind-down process, with a further status update expected in the Q4 2026 interim portfolio report.

6. Petotum

Partner-in-charge: Shan Li

H1 2026 Status Summary

As reported in H2 2025, Petotum appeared to have stabilised its operations following its strategic pivot to GoPetAI, a SaaS platform for pet businesses. At that time, management reported encouraging early customer traction and recurring subscription revenue, suggesting the business had identified a potential pathway towards recovery.

Unfortunately, during H1 2026, the Fund has been unable to verify the company's current operating or financial position. Despite repeated attempts to contact both co-founders, communications have ceased and the company has not provided the operational, financial or governance updates expected under its shareholder obligations. As a result, the positive trajectory reported previously can no longer be independently substantiated.

Given the prolonged lack of engagement, the Investment Committee has determined that the Fund should undertake a formal due diligence and verification exercise to establish the company's current legal, financial and operating status before determining the appropriate accounting treatment for the investment.

While it is possible that the investment may ultimately require a write-down or write-off during 2026, the Fund has a fiduciary responsibility to first complete reasonable verification procedures and document the current status of the company before making that determination.

The activities to be undertaken during the next review period include:

- conducting updated company searches and reviewing statutory filings with the Companies Commission of Malaysia (SSM);
- reviewing the latest available financial statements and statutory filings, where available;

- assessing whether the company remains active, solvent and compliant with its statutory obligations;
- continuing documented attempts to contact both founders and request updated operational and financial information;
- evaluating whether there remains any realistic prospect of business recovery or shareholder value; and
- presenting the findings to the Investment Committee to determine the appropriate course of action, including whether a write-down or write-off is warranted.

The outcome of this review will be reported to Limited Partners in the Q4 2026 interim portfolio update, together with the Investment Committee's recommendation on the future treatment of the investment.

7. SonicBoom

Partner-in-charge: Doc Siva

H1 2026 Performance Summary

On its standalone FY2025 management accounts, SonicBoom recorded revenue of RM12.04 M (RM13.50 M including other income), a gross margin of approximately 74%, and a profit after tax of RM1.18 M, and closed the year with a strong balance sheet – around RM6.6 million of cash – and customer churn below 2%. Management is targeting 30% revenue growth for 2026 and is opening a significant new domestic growth vector in residential (strata) visitor parking, which it characterises as a green-field opportunity. Most materially for the fund, the exit process is now live: SonicBoom has engaged a boutique M&A advisor, and is in active discussions with potential acquirers. The founders' clear preference is a strategic trade sale over a public listing. More on this below.

Comparison with H2 2025

At the close of H2 2025, SonicBoom had reported FY2025 revenue of RM13.5 M (pending audit, up 22% on RM11.03 M in 2024), profitability, a Malaysia-centric revenue base, marquee mall contracts including TRX and KLCC and competitor displacements at Setia City Mall and IOI City Mall.

In December 2025 they appointed B2B Capital to source acquirers. Half-on-half, the exit thesis has advanced from mandate to live process: the advisor is now in active acquirer discussions. The FY2025 accounts show the company to be profitable and cash-generative, though at more moderate margins than management's verbal guidance implied (see Financial Performance).

Core Parking Business and Competitive Position

Parking continues to account for roughly 70% of SonicBoom's revenue, underpinned by long contracts with lifetime values of five to seven years. The company competes on service quality and system performance rather than price – pricing sits within about 10% of competitors – and its reliability record generates meaningful inbound demand from large enterprise venues, supplemented by proactive outreach where an opening

exists. The IOI City Mall contract, won by demonstrating superior service in a head-to-head trial, is being deployed at the mall, with further associated sites expected to follow as the incumbent competitor's contracts expire over roughly the next 18 months. Rebuilding a repeatable competitive "playbook" for such displacement wins is a stated priority for the year.

Business Strategy & Planning

SonicBoom's principal new initiative is a purpose-built solution for residential (strata) visitor parking — a segment management views as a large, uncontested green field. The thesis is that visitor parking bays in strata developments are widely uncapped: regulatory requirements since around 2016 oblige developers to provide digital/visitor parking (typically 10–20% of bays, with some earlier developments at 5%), so a 500-unit project may hold 50 to 100 or more visitor bays. By automating hourly and overnight visitor charging (for example, a free grace period followed by hourly and overnight fees) in place of error-prone, human-managed collection, SonicBoom can convert this into recurring income that flows back into the property's maintenance fund — estimated at around RM5,000 per strata project — while it funds the capital and operating costs and takes a share.

Crucially, adoption requires only Joint Management Body or Committee approval rather than individual resident consent, since parking is common property and proceeds support common maintenance. With roughly 20,000 strata projects in Malaysia and an ideal-customer subset of perhaps 4,000–5,000, management is pursuing a marketing-led, low-touch scaling model — built on education, market interest, and referral incentives (around RM1,000 per site on go-live for referring agents or JMBs) — rather than a headcount-heavy sales push, given the impracticality of individually negotiating hundreds of sites. The stated goal is to reach somewhere between 500 and 1,500 sites over the next twelve months and establish early category leadership, with on-the-ground traction to be proven over that period.

Regional Expansion

Internationally, SonicBoom is focused on Vietnam, Indonesia, the Philippines, and Thailand — each a materially larger population and mobility market than Malaysia. In Vietnam, the company has spent early 2026 solving a structural deployment problem: rather than incurring high capital and manpower costs to clear payment-compliance requirements at every new site, it has developed an approach — in conjunction with

banks and payment acquirers – to replicate live sites more cheaply, keeping the (still pre-revenue) market open at better unit economics. In Indonesia, two contracts are pending go-live, with compliance resolved and client payment now the gating step; management is also pursuing higher-margin street-parking opportunities in a market that remains largely cash-based today. The previously flagged Indonesian MRT opportunity has become less attractive, as Japanese funding of the infrastructure requires Japanese main contractors, raising risk and compressing margin; management may decline it in favour of everyday, higher-margin work.

Financial Performance

SonicBoom's FY2025 management accounts (standalone Sonicboom Solutions Sdn Bhd, MFRS basis) show total revenue of RM12.04 M, rising to RM13.50 M including other income – consistent with the RM13.5 M pending-audit figure cited in H2 2025. Recurring lines (SaaS, season-pass, and service subscriptions) contributed roughly RM7.8 M, about 65% of revenue, rising close to 80% once recurring payment income is included, corroborating management's 70% recurring characterisation. Gross profit was RM8.88M, a gross margin of approximately 74%. After operating expenses – dominated by around RM7.0 M of wages and salaries, which includes roughly RM1.44 M of year-end director fees and salaries – the company delivered an operating profit of RM1.25 M and a profit after tax of RM1.18 M (a net margin near 10%). EBITDA was approximately RM1.8 M, or about 15% of revenue.

The balance sheet is robust. At 31 December 2025 the company held approximately RM6.57 M of cash (including RM3.95 M in fixed deposits) and RM2.61 million of trade receivables, against total assets of RM11.93 million. Customer retention remains excellent, with churn below 2% (approximately 1.5% in the prior year against a sub-5% target), driven overwhelmingly by land redevelopment, ownership changes, or venue closure rather than competitive loss (estimated well under 1%). The combination of long-dated contracts, high recurring revenue, positive net income, a strong cash position, and negligible churn is precisely the profile that supports the company's exit positioning – albeit at more moderate profit margins than management's verbal guidance implied.

Exit Strategy and Investment Outlook

The exit process is now the central story for the fund. No offers have yet been tabled, but management expects initial valuation indications within the next two to three

months, and the advisor intends to assemble at least three to five offers before establishing a market-clearing value – implying a potential crystallisation of price around the third quarter of 2026.

Management's clearly stated preference ranks a strategic acquirer first – ideally an operator in the same space but a different geography, which would both maximise valuation and make any earn-out more achievable through genuine commercial synergy – followed by a general financial acquirer that likes the business model (typically at a lower valuation), with private equity and an IPO ranked last. Management is notably wary of a private-equity outcome, viewing it as likely to benchmark valuation conservatively and to make earn-outs difficult given limited industry synergy. An IPO remains technically available – the founders completed the setup some time ago and hold an indicative self-assessed valuation of 12–15x PE – but they actively prefer a trade sale, having no appetite to run a public company; should the process point that way, the listing route would be revisited around September to November 2026.

From a portfolio perspective, Sonicboom exits H1 2026 as the fund's most advanced exit candidate: a profitable, high-recurring-revenue, low-churn regional platform with a live, advisor-led sale process and imminent price discovery. The near-term risks are execution-side and converting the residential and regional pipelines – but the dominant variable for LPs over H2 2026 will be the quality and level of acquisition offers received, and whether a strategic buyer emerges at a valuation the founders and shareholders are prepared to accept.

NOTE : SFF invested in the following companies as strategic investments for the fund. All companies raised funding from marquee investors and as the partners had good relationships with the startups, we were invited to join their investment rounds. The updates on these strategic investments will not have the same level of detail as with our direct investments above as these companies report to their lead investors and provide smaller investors like SFF with summary reports.

8. i-Motorbike

Partner-in-charge: Aaron Sarma

H1 2026 Performance Summary

iMotorbike carried its strong operating momentum into 2026, opening the year with a record. January 2026 delivered approximately USD 1.195M of revenue – the strongest month in the company's history – on 661 motorcycles sold (a new record, surpassing December), with gross profit of USD 285,623 at a 23.9% margin and 1,456 total transactions.

Trading moderated but remained robust through the second quarter: May 2026 recorded approximately USD 1.06 million (611 units, 20.1% gross margin) and June USD 1.00 million (562 units, 19.1% gross margin), with management reporting that Q2 finished as the second-strongest quarter on record, effectively level with the record Q1. Full monthly detail for February to April was not provided.

Two features stand out for the half. First, while the top line stayed above USD 1M every month reported, both monthly volumes and gross margins softened from the January peak (from 23.9% to 19.1%), a trend worth monitoring. Second, and importantly for the fund, the newly received FY2025 consolidated accounts show that despite record revenues, iMotorbike remained loss-making at the group level in 2025, recording a net loss of approximately USD 2.26M on revenue of USD 8.90M, a reminder that the company is still prioritising scale over profitability. Strategically, the half saw the Go Vap flagship in Ho Chi Minh City come fully live, the Shell inspection-centre network in Malaysia reach 18 locations, and the Malaysian service/refurbishment centres open to the public as a new revenue line.

Comparison with H2 2025

At the close of H2 2025, iMotorbike was described as one of the portfolio's strongest-performing assets: December 2025 had exceeded USD 1.0M in monthly revenue (USD 1.053M), the annualised run-rate was USD 12.6M, FY2025 revenue was estimated at USD 8.51M, and expansion was underway across Malaysia (Shell, then 14 locations), Vietnam (Hanoi, plus the Go Vap flagship in renovation) and Penang.

The operation remains one of record-setting scale: January 2026 set a new monthly revenue and volume record, the Go Vap flagship is now open with capacity cited at 1,000 units, and the Shell network has grown to 18 sites. Two things are now clearer than in H2 2025, however. The final FY2025 revenue came in higher than estimated, at USD 8.90M on the consolidated accounts, but those same accounts reveal a group net loss of USD 2.26M, a dimension the prior narrative-only update did not quantify. And within H1 2026, the monthly trajectory softened from the January high, with gross margins compressing through the second quarter. The company is thus growing strongly and improving gross margins versus the FY2025 average, but profitability at the net level remains the central open question.

FY2025 Financial Position

The consolidated FY2025 accounts for iMotorbike Pte Ltd (comprising the Malaysian, Singapore and Vietnamese entities) show total trading income of USD 8.90M, mainly from motorcycle sales (USD 8.78M net) – against cost of sales of USD 7.45M, giving a gross profit of USD 1.45M, a gross margin of approximately 16.3%.

After other income of USD 0.11 million and total operating, selling and employee costs of roughly USD 3.83M (the largest components being staff salaries of approximately USD 1.35M, advertising and marketing of USD 0.43M) and, the group recorded a net loss of approximately USD 2.26M for the year.

The balance sheet reflects a working-capital-intensive marketplace. At 31 December 2025 the group held approximately USD 2.96M of cash and total current assets of about USD 11.97M (the bulk being motorcycle inventory and receivables), funded in part by short-term loans of roughly USD 1.57M. The scale of inventory and receivables underscores that growth in this model consumes working capital, making inventory turnover and financing cost important to the eventual margin profile.

Strategic Footprint and Operational Progress

Operationally, H1 2026 advanced the regional build-out described in H2 2025. In Vietnam, the new flagship dealership in the Go Vap District of Ho Chi Minh City under renovation at the last report, opened on 22 January 2026 and is now fully live, providing roughly 1,000 units of capacity to support the next growth phase and strengthening southern-Vietnam coverage alongside the established Hanoi presence. In Malaysia, the Shell inspection-centre partnership expanded to 18 active locations across high-traffic corridors.

The most notable new development is the emergence of after-sales as a revenue stream: the company's service and refurbishment centres in Kuala Lumpur, Johor Bahru and Penang are now open to the public, converting what were internal reconditioning functions into a monetisable, potentially higher-margin line. Management also reports an end-to-end process review across the Malaysian operation through the lens of compliance, cost efficiency and operational excellence, with the Vietnamese operation undergoing the same, an efficiency agenda that, if effective, should help address the net-loss position.

Investment Outlook

As a strategic investment, iMotorbike continues to report at a summary level, but the picture entering H2 2026 is more nuanced than the unqualified strength of the prior update. On the positive side, the company remains one of the portfolio's clearest top-line performers, record revenues, a sustained USD 1M-plus monthly run-rate, improving gross margins versus the FY2025 average, expanding physical footprint, and a promising new after-sales revenue line. Against that, the FY2025 consolidated net loss of approximately USD 2.26 million, the softening monthly trend and margin compression through Q2, and the working-capital intensity of the model mean the key question for value creation is the path from scale to profitability. The efficiency review and the higher-margin service-centre revenue are the levers to watch.

9. Fefifo

Partner-in-charge: Aaron Sarma

H1 2026 Performance Summary

H1 2026 was, by design, a consolidation and development period for Fefifo rather than a growth half. Having executed its decisive reset in H2 2025 – exiting structurally fragile wholesale food trading after a major client default – the group completed the operational restructuring outlined previously and now runs a deliberately lean, two-part structure:

- Fefifo as the strategic holding and upstream supply/infrastructure platform
- GB&C (the JV with the JAPFA family office, Altrui) as the primary downstream FMCG commercialisation vehicle.

Group revenue for the half was approximately RM 450.00K, reflecting a period of product and channel development ahead of a wider commercial rollout rather than any operational setback.

The most consequential development for the fund is on exit timing: management has revised the indicative strategic ownership-transition (trade-exit) horizon from end-2026 to **end-2027**, citing the updated FY2026–2027 commercialisation timeline. Otherwise the half delivered steady groundwork – Farmière RTE products listed across AEON nationwide and selected Jaya Grocer outlets, active Japan market-entry discussions (including with Don Quijote/Donki's Japan headquarters), and a restructured digital go-to-market function – against a financial backdrop that remains fragile:

- the FY2025 accounts show a group net loss of approximately RM 1.08M, negative equity, and thin cash, with operations underpinned by the RM 3.10M Altrui working-capital facility.

Comparison with H2 2025

At the close of H2 2025, Fefifo had completed its pivot from wholesale trading to a focused FMCG brand owner, reporting approximately RM 900.00K in underlying trading revenue for FY2025 (before the one-off share-sale gain and inter-company fees that lift the consolidated figure to RM 2.66M – see below), around 75% cut in monthly burn (from approx. RM 115.00K to RM 27.00K at the Fefifo Malaysia level), the formalisation

of GB&C as the JAPFA JV commercial vehicle, a RM 3.10M Altrui working-capital facility, and an explicit trade-exit-to-Altrui roadmap targeted for end-2026.

Half-on-half, execution has continued along that plan, but two things have moved. First, the exit horizon has been pushed out a year, to end-2027 — the single most important change for LPs, reflecting the reality that rebuilding a branded FMCG business to an exit-ready state is taking longer than the original timeline assumed. Second, the newly available FY2025 consolidated accounts give a fuller financial picture than the headline revenue figure alone: underlying external trading revenue was modest (roughly RM 900.00K), the group was loss-making (RM 1.08M net loss), and the balance sheet carries negative equity. On the positive side, product and retail traction has advanced (AEON nationwide listing, Japan entry discussions, a new convenience-bakery range), and the capital posture remains disciplined, with no new equity raise planned and principal protection prioritised.

FY2025 Financial Position (Consolidated, Unaudited)

The FY2025 consolidated accounts require careful reading. Reported total revenue of RM 2.66M is materially flattered by two non-trading items: a one-off gain of approximately RM 870.00K on the sale of GB&C Pte Ltd shares, and approximately RM 890.00K of inter-company shared-services fees. Stripping these out, underlying external trading revenue was approximately RM 900.00K comprising:

- wholesale food supply : RM 620.00K
- co-farm build-operate-offtake consultancy : RM 210.00K
- GB&C branded sales : RM 70.00K

Against total operating expenses of RM 2.42M (of which staff cost was around RM 1.61M and advertising and promotion around RM 200.00K), the group recorded a **net loss of approximately RM 1.08M** for the year; on a quarterly basis, a Q1 profit driven by the one-off share-sale gain was followed by operating losses in Q2–Q4.

The balance sheet reflects a thinly capitalised, restructuring business. At 31 December 2025 the group held only approximately RM 180.00K of cash, alongside trade receivables of RM 540.00K and inventory of RM 150.00K. Total equity was negative at approximately RM 4.90M, weighed down by accumulated losses at the Fefifo Malaysia level and a capital structure heavy with SAFE holders' investment, convertible equity and convertible loan stock. In practical terms, the business depends on the Altrui

working-capital facility and disciplined cost control to fund its path to an exit rather than on internally generated cash.

Product, Channel and Market Progress

Commercially, H1 2026 was about building the branded platform. Fefifo has narrowed to two brands with clear positioning: Farmière™ (mid-premium, rebranded from "Farmers"), which the group has expanded across Ready-to-Eat, Ready-to-Heat and Ready-to-Cook formats; and The Castle Pantry™ (mass-market spices, dry goods and powders, using JAPFA-linked raw materials). Farmière RTE lines are now listed with selected Jaya Grocer outlets and across AEON nationwide, and packaging variants are being customised for Japan, where market-entry discussions – including engagement with Don Quijote (Donki) in Japan – are progressing, alongside development conversations in Singapore, Hong Kong and China.

Just after the period, in July 2026, the group introduced Farmière À la Minute, a Ready-to-Heat artisan convenience-bakery range, at Food & Drinks Malaysia 2026, and is developing it for convenience retail (7-Eleven, FamilyMart, myNEWS); 12-month shelf-life export variants are also in development. On the demand side, GB&C is shifting emphasis toward online social commerce, activating a content-creator agency for recurring monthly video content and onboarding a fractional Digital Growth Lead in July to build a more measurable demand-generation engine alongside physical retail. Upstream, Fefifo continues to cultivate government and GLC-linked opportunities, including the Mambong Sarawak consortium and FELDA. Import licences and Halal/HACCP certifications remain in place, and the company retains its registered social-enterprise status.

Investment Outlook

As a strategic investment, Fefifo continues to be reported at summary level, and the H1 2026 picture is best read as deliberate groundwork toward a delayed exit rather than as near-term financial performance. The positives are a genuinely leaner and less risky business than a year ago, tangible retail traction (notably the AEON national listing and Japan entry work), a disciplined capital posture with no dilutive raise planned, and continued backing from the JAPFA/Altrui relationship that also represents the eventual acquirer. The offsetting realities are material: revenue remains small, the group is loss-making with negative equity and minimal cash, and most significantly the trade-exit horizon has slipped from end-2026 to end-2027, deferring the fund's expected liquidity

event by a year and making it contingent on the branded FMCG business demonstrating the commercial traction and margins a buyer will require. The key markers to watch are the conversion of retail listings and the new social-commerce engine into growing sell-through, evidence of narrowing losses, and confirmation that the Altrui transition remains on track for its revised timeline.

H1 2026 Performance Summary

H1 2026 represented a period of consolidation and disciplined execution for EARTH following the exceptional growth achieved during FY2025. After exiting 2025 with record commercial momentum, the company experienced a softer first half as management navigated a combination of seasonal market conditions and internal execution challenges. While these factors moderated revenue growth during the period, management responded quickly with organisational changes that restored commercial momentum, culminating in a record revenue month in June 2026.

More importantly from an investment perspective, the strategic direction established during H2 2025 continued to mature. EARTH further strengthened its enterprise-focused business model by expanding its Circularity-as-a-Service offering, demonstrating significantly higher value creation through refurbishment rather than conventional recycling. At the same time, management adopted a more disciplined capital strategy, choosing to prioritise profitable, contract-led growth over external fundraising.

Commercial Performance and Strategic Progress

The enterprise and reverse logistics strategy introduced during H2 2025 continued to gain traction during H1 2026. Rather than relying primarily on consumer e-commerce growth, EARTH increasingly focused on enterprise customers seeking circular economy solutions and asset recovery services.

A significant development during the period was the commercial validation of EARTH's Circularity-as-a-Service model through telecommunications equipment refurbishment. Building on capabilities previously developed within its reverse logistics operations, the company demonstrated that recovered network equipment could be refurbished and returned to enterprise customers at substantially lower cost than purchasing new equipment, while extending product life and reducing electronic waste.

The opportunity originated from an existing enterprise customer that had initially engaged EARTH to collect and recycle returned telecommunications routers. Rather than treating the equipment as scrap, management invested in refurbishment capability and

proposed supplying refurbished units back to the customer at approximately RM50 per unit, compared with the cost of around RM300 for a new replacement. Following the successful delivery of an initial 500-unit pilot, the customer increased its commitment from 10,000 to 20,000 units for delivery by the end of 2026.

This validates the strategic direction established during 2025 and reinforces management's shift towards enterprise-led growth. By extracting significantly greater value from assets already collected through its logistics network, the refurbishment model provides a more scalable and commercially attractive revenue stream than relying predominantly on consumer e-commerce. Management has since commenced discussions with three additional telecommunications operators, providing confidence that the model is both repeatable and capable of supporting future enterprise revenue growth.

Enterprise Partnerships

ERTH continued to strengthen relationships with enterprise customers established during 2025, including Petronas, Hong Leong, Standard Chartered and Maxis, supporting the company's continued transition towards enterprise sustainability and circular economy solutions.

While management elected not to proceed with the previously proposed Panasonic investment, discussions remain positive and Panasonic has indicated its intention to continue engaging ERTH as a recycling and circular economy services provider as industry regulatory requirements evolve.

Revenue Quality and Business Mix

Management has revised FY2026 revenue expectations to approximately RM6–7 million. This reflects a more conservative outlook driven by softer macroeconomic conditions, supply constraints affecting the availability of imported refurbished devices, and management's deliberate decision to redeploy inventory into the rapidly expanding refurbishment business to support customer delivery commitments.

Importantly, the enterprise refurbishment programme forms part of the service revenue pipeline discussed in the previous reporting period. While this has moderated short-term revenue growth, management believes the strategy will generate stronger

margins, improve cash generation and provide a scalable platform for future enterprise contracts.

The commercial attractiveness of the model is reflected in its unit economics. Under ERTH's previous recycling model, each recovered router generated approximately RM2 of revenue. Through refurbishment, each unit is sold for approximately RM50, with around RM10 allocated to replacement adapters and accessories, resulting in an estimated RM40 contribution per unit. By leveraging ERTH's existing reverse logistics infrastructure, management expects this significantly higher-value business line to become an important contributor to both revenue growth and profitability over the coming years.

Operations and Organisation

During H1 2026, management implemented organisational changes following a senior leadership appointment that ultimately proved unsuitable for ERTH's operating environment. Following the founder's return to direct commercial leadership, execution improved significantly, contributing to the company's record June performance.

Although management had initially planned to maintain a hiring freeze during H1 2026, the rapid scaling of the telecommunications refurbishment programme required additional operational capacity. Headcount therefore increased through the recruitment of junior operational staff to support a fourfold increase in refurbishment output while management continued to optimise operating expenditure, reducing average monthly burn from approximately RM250,000 to RM200,000.

Capital Strategy

One of the more significant strategic developments during H1 2026 was management's decision not to proceed with the previously anticipated Panasonic-linked strategic investment or the Singapore debt facility.

Although the Panasonic-linked investment progressed to an executed term sheet following due diligence, management ultimately concluded that the proposed investment structure was not aligned with the interests of existing shareholders. Rather than accepting terms that could constrain future strategic flexibility, management elected to focus on executing the growing enterprise refurbishment opportunity, which

they believe offers a stronger long-term value creation pathway through commercial growth rather than shareholder dilution.

Similarly, management declined the previously proposed Singapore debt facility in favour of a more flexible invoice financing arrangement with an existing trade partner. The facility enables ERTH to accelerate cash collection when required to support larger customer orders, while avoiding unnecessary borrowing costs during periods where operating cash flow remains sufficient to fund growth.

Together, these decisions reflect management's disciplined approach to capital allocation, prioritising shareholder alignment, financial flexibility and sustainable organic growth over raising external capital for its own sake.

Investment Outlook

H1 2026 demonstrated management's willingness to prioritise long-term value creation over short-term growth. While revenue expectations for FY2026 have been moderated to reflect prevailing market conditions and the strategic redeployment of resources towards enterprise refurbishment, the underlying investment thesis has strengthened.

The successful commercialisation of ERTH's Circularity-as-a-Service model validates the enterprise and reverse logistics strategy introduced in H2 2025 and demonstrates management's ability to identify higher-value commercial opportunities from existing operational capabilities. Combined with disciplined capital allocation and a growing pipeline of enterprise opportunities, ERTH is building a more profitable, cash-generative and scalable business that remains well aligned with Scaleup's longer-term investment objectives and strategic exit horizon.

11. Kiddocare

Partner-in-charge: Renuka Sena

H1 2026 Progress Summary

H1 2026 marked an important transition in Kiddocare's evolution from a high-growth on-demand childcare platform into a broader care ecosystem supported by increasingly diversified and recurring revenue streams. While the company's core on-demand babysitting business experienced a softer first half due to an unusually compressed public holiday calendar, total revenue continued to grow, demonstrating that newer business lines are beginning to meaningfully reduce reliance on transactional bookings.

Total revenue increased 20.9% year-on-year to RM8.95 million (H1 2025: RM7.40 million), building on the record RM21.6 million achieved during FY2025. The period also represents a significant milestone in Kiddocare's capital raising journey, with management signing a Series A term sheet with a strategic and institutional investor following an extended period of due diligence. Although the transaction has yet to close, the signed term sheet represents an important validation of both the company's operating performance and long-term strategic direction.

Together, these developments reinforce management's strategy of building a more resilient, multi-service care platform while positioning the business for its next phase of institutional growth.

Financial Performance and Revenue Mix Evolution

Kiddocare continued to deliver top-line growth during H1 2026, recording total revenue of RM8.95 million, representing a 20.9% increase over H1 2025. While this represents a slower pace of growth than the exceptional expansion recorded during FY2025, the underlying composition of revenue illustrates a business becoming increasingly diversified.

On-demand childcare revenue declined to RM4.10 million from RM4.70 million in the corresponding period last year, with bookings reducing approximately 19% to 41,963 sessions. Management attributes the decline primarily to calendar effects, including an unusually high concentration of public holidays, the timing of Chinese New Year and an

earlier Hari Raya school holiday period, all of which reduced the number of normal working days during the half.

More importantly, however, on-demand childcare now accounts for less than half of total revenue. The majority of revenue is increasingly generated through complementary business lines including Klevercape childcare centre subscriptions, care packages and media-related services. This reflects the strategic platform expansion initiated over the past two years and reduces the company's reliance on short-term booking volumes that naturally fluctuate with seasonal demand.

Management expects this diversification to continue with the planned launch of tuition services during Q3 2026, providing additional cross-selling opportunities to Kiddocare's growing customer base while expanding lifetime customer value across the broader childcare ecosystem.

Operations and Care Supply

Operational execution remained stable despite softer booking volumes. During the first half, 1,301 active carers generated income through the platform, receiving total payouts of RM3.29 million with average earnings of approximately RM2.4K per active carer.

Kiddocare continued expanding its care workforce, onboarding 491 new carers during the period, of whom 263 had already begun earning income and collectively generated RM351,990 in payouts. Importantly, retention remained healthy, with 51.5% of carers active during H1 2025 continuing to remain active one year later, demonstrating sustained engagement despite lower booking activity.

The renewal of the Khazanah K-Youth Development Programme continues to strengthen Kiddocare's long-term talent pipeline, while management has also initiated discussions with government agencies regarding broader workforce development and care infrastructure initiatives that could further reinforce the company's leadership position within Malaysia's formal care economy.

Product Development and Platform Enhancement

Following the ecosystem expansion initiatives introduced during FY2025, H1 2026 focused on improving conversion, user engagement and marketplace efficiency across both sides of the platform.

For parents, Kiddocare introduced several features designed to improve convenience and encourage repeat usage, including one-click rebooking, automated promotional offers, simplified authentication through Google and Apple sign-in, reusable booking checklists, integrated tipping functionality and a new onboarding experience highlighting platform trust credentials.

On the supply side, the company enhanced the carer experience through self-paced digital training modules, improved job matching and preferred working-hour settings, enabling carers to become productive more quickly while improving marketplace efficiency.

These product enhancements are intended to improve customer conversion, increase repeat bookings and accelerate activation of newly recruited carers, supporting long-term platform utilisation rather than near-term transaction growth alone.

Customer Growth and Ecosystem Expansion

Customer acquisition remained healthy during the period, with 11,824 new users registering on the platform and 6,927 customers making paid bookings. The company also recorded 3,187 first-time bookings, including almost 800 users who had previously registered but only converted into active customers during H1 2026.

Management's focus has increasingly shifted from pure user acquisition towards improving customer conversion and lifetime value. This aligns with Kiddocare's broader ecosystem strategy, whereby childcare services, childcare centres, educational offerings and future complementary services can be cross-sold across an expanding customer base.

The planned launch of tuition services during Q3 2026 represents the next stage of this ecosystem strategy, extending Kiddocare's engagement with families beyond childcare while creating additional recurring revenue opportunities.

Investment Progress and Outlook

The most significant strategic development during H1 2026 was the advancement of Kiddocare's Series A fundraising process.

Following extensive engagement with multiple local and international investors throughout 2025, management has now signed a Series A term sheet with a strategic

and institutional investor and is progressing through the final stages required to complete the transaction. While the final investment amount, valuation and investor identity have not yet been publicly disclosed, execution of the term sheet represents a significant progression from the due diligence stage reported previously.

Proceeds from the financing are expected to accelerate product development, expand marketing initiatives and support further rollout of the Klevercape childcare centre network, providing the capital required to execute Kiddocare's next phase of growth.

Looking ahead to H2 2026, management's key priorities include completing the Series A financing, expanding higher-quality recurring revenue streams, launching tuition services and monitoring the recovery of on-demand booking volumes as holiday patterns normalise. Although the first half demonstrated the seasonality inherent within the on-demand childcare business, the continued expansion of diversified revenue streams and positive fundraising progress provide increasing confidence that Kiddocare is evolving into a broader, more resilient care platform capable of delivering sustainable long-term growth.
